SKILLSET

Languages JavaScript, Ruby, PHP
Database Experience PostgreSQL, mySQL, mongodb
Platform Experience **Frameworks:** node.js, Ruby on Rails, Laraval
Cloud Related: AWS (Redshift, EC2, ELB, Lambda, VPC, [awscli](#), [API Gateway](#), [CloudFormation](#)), GCP ([GKE](#), Cloud Run, [Cloud PubSub](#)), [serverless](#)
CI/CD: [Jenkins-X](#) (jx), ElasticBeanstalk (AWS), Cloud Build (GCP) + Github Actions + supporting cast (eg. [Super Linter](#))
Other Abilities / Tools command line (zsh, tmux, emacs, ssh) in *nix environments, monitoring (Grafana) & logging (CloudWatch, Splunk), documentation (markdown, wiki + Atlassian), [Typescript](#) + [React](#)

EXPERIENCE

01/2024 - present **Freelance Software Developer**

Automated a manual-entry workflow involving 3 companies and 1.5 years. Created and coordinated a detailed project plan of action in order to minimize friction between numerous API revisions. Released code with no faults ensuring customer satisfaction and seamless rollout from staging to production.

Utilized TDD (test driven development) to add new product lines with less need for comprehensive end to end testing along with requisite frontend code needed for new customer options.

Team lead on a company turnaround. Identified key areas for site improvement through analytics and led initiatives to drive conversion rate resulting in a significant rebound (~2.5x) and used a/b tests (Google Analytics, Intelligems) to validate.

Translated wireframe concepts from [Figma](#) into new user interfaces.

Combined 3rd party APIs (eg. [FedEx Track](#), [Shopify Admin GraphQL](#)) into new user interfaces from design to integration.

Improved UX across key site features within a legacy jQuery frontend environment.

Launched a lightweight internal knowledgebase using a containerized [wiki.js](#) on [Google Cloud Run](#) which provides training, a consolidated data/knowledge source, and facilitates onboarding through formalizing SOP's.

10/2020 - 12/2023 [Port80](#)

Freelance Software Developer

Translated vague requirements into an enterprise CRM for a rapidly growing recycling firm which involved turning complex business rules into dozens of forms (React, [Formik](#)) from signup to login (including 2FA using [Twilio](#)) as well as client management, materials entry, file uploads, invoicing, etc. on top of a node.js backend deployed on [Google Cloud Run](#) via [Github Actions](#). Wrote and maintained copious SQL queries (mysql) often involving complicated joins.

Performed security audits using [SNYK](#) to identify latent issues resulting from a preexisting lack of best practices, eg. migrating user passwords away from MD5.

Utilized Shopify and supporting technologies from node.js (on koa or express, jest for TDD) to React (incl. [mobx-state-tree](#), [styled-components](#), React Hooks), and [Shopify's GraphQL](#) where applicable to develop storefronts and backend integrations (eg. [Logicbroker](#) logistics) for a variety of client requests.

Overcame challenges resulting from a fast-paced environment often splitting time between disparate projects and managing junior developers residing in different timezones worldwide.

11/2017 - 7/2020 [SEIU 775 Benefits Group](#)
Sr. Software Developer

First senior hire for a new agile development team focused on development of an online learning management system. Provided team leadership during rapid expansion of the enterprise, including the addition of 5 additional developers (while fully remote).

Architected and coded node.js microservices meshes on Kubernetes and ElasticBeanstalk utilizing an event-driven architecture via Cloud PubSub and SQS/SNS.

Designed and implemented APIs from definition to API gateway, automating resource deployments to our VPC leveraging CloudFormation templates (later serverless) to mitigate future waste.

Improved team efficiency through guidance and mentorship of junior developers (eg. command line tools, CI/CD tooling, knowledgebases, code review), providing instruction materials on a weekly basis.

05/2017 - 08/2017 [Port80](#)
Freelance Software Developer

Architected and built a node.js backend to integrate [StitchLabs](#) (an e-commerce platform for supply chain management) with various vendor distribution centers to connect small retailers to larger distribution systems.

Overcame systemic challenges arising from intermittent failure in client authentication systems. Assisted their internal teams in reproducing and diagnosing the root cause, going past business hours as needed.

02/2012 - 01/2017 [Full Circle](#)
FrontEnd / FullStack Developer

Successfully replaced a legacy PHP site with a responsive single-page webapp using backbone.js (at the dawn of SPA's). Public-facing functionality included member signup, shopping cart, account management, and seasonal promotions, leading to sustained growth from \$6m to \$16m over 3 years.

Took lead on design, UX direction, and engineering of a comprehensive frontend toolset for distribution center management to inform our produce-buyer decisions + input new products / inventory, and to support the in-house customer service team. Worked closely with all relevant stakeholders to ensure their business needs were met or their processes were improved as a result.

Employed TDD to ensure a reliable UI with minimal downtime through regular regression testing via [Jasmine](#) + [Sinon](#).

08/2011 - 02/2012 [Blue Nile](#)
Developer, FrontEnd

Built new features as part of the Site Development team, such as filtering for Build Your Own Jewelry interface, or process improvements for laborious holiday site-theming.

Maintained an aging JSP framework which was glued together with monolithic JS using jQuery.

Drove and developed a YAML-driven promotion engine to improve efficiency of launching new features which include new business rules as well as allowing for UAT to be completed within the time constraints which arise each holiday season.

01/2011 - 06/2011 [United Business Media](#)
Developer

Web application development, site maintenance, and event production for the [Black Hat](#) brand.

Created micro-sites for our events / conferences using a minimized toolset consisting of a static-site generator and a serious command of regular-expressions.

Sole-developer on the first refactor of the CFP (call for papers) system from database design to implementation in Rails.

08/2008 - 11/2010

[Bag Borrow or Steal](#)
Developer

Specialized in frontend development using Freemarker and JS (jQuery + Prototype) on a medium-scale enterprise stack (Java, Spring, Struts, and Hibernate on Tomcat).

Heavily focused on exploratory work and prototyping of new features, such as improved quick-look / zoom within the product browse interface.

Integrated a from-scratch interface with a backend API built out as part of a total migration of inventory to an in-house storage facility, the rollout of which had a hard deadline and where failure was not an option.

EDUCATION

08/2001 - 12/2002 **University of Texas at Austin**, Computer Science

08/2005 - 12/2005 **University of Texas at Austin**, Computer Science

INTERESTS

Professional pushing the web forward (eg. WebAssembly, Rust, Flutter), functional languages, infosec, UX principles (eg. Krug)

Other espresso, audio engineering, electronic music, motorsport
